

TETRA Group Call Bridge

The TETRA Group Call Bridge from DAMM is a solution to connect a DAMM TetraFlex® network to another TETRA network system.

The following diagram shows an overview of the DAMM TETRA Group Call Bridge solution:

When a group call is initiated on a radio either connected to the TetraFlex® network or to another TETRA network, the call can be routed through the Group Bridge. The groups which should be joined must be configured in the Group Bridge application.

The group bridge is connected to the TetraFlex® network through the standard TetraFlex® application gateway over a WAN connection and to the other TETRA network through the PEI interface on a radio.
